(57) Abstract :

A device for controlling electronic components of an elevator is disclosed. The device includes: a first set of sensors configured within a passenger compartment of the elevator, the first set of sensors configured to sense one or more attribute values of one or more passengers to detect presence of the one or more passengers in the passenger compartment, and generate a signal based on the sensed one or more attribute values; and a control unit operatively coupled with the first set of sensors, the control unit configured to receive the signal from the first set of sensors, wherein the control unit is configured to turn ON a set of electronic components of the elevator based on the received signal, and wherein the control unit is configured to turn OFF the set of electronic components of the elevator based on absence of the signal.
