(57) Abstract :

The present disclosure provides a drilling apparatus that can be used for providing machining operation at various angles on a workpiece. According to an aspect, the apparatus can include a bed adapted for holding one or more work pieces for machining operation; and a base adapted for supporting the bed, wherein the bed is slidably supported on the base such that the bed is free to move at predefined angular positions with respect to the base to facilitate machining operation of the work piece at various positions.
