(57) Abstract :

According to an embodiment, the present disclosure provides a brake light(s) system for vehicle. The system includes a set of sensors configured on a front portion of a first vehicle to sense one or more attributes associated with a second vehicle positioned in front of the first vehicle, a control unit operatively coupled with the set of sensors to extract one or more parameter values from the sensed one or more attributes. Compare the extracted one or more parameter values with a dataset comprising a set of predefined threshold values pertaining to the one or more, wherein based on the comparison when the extracted one or more parameter values is more than the predefined threshold values, the control unit generates an alert signal indicative of the second vehicle being within a predefined threshold of the second vehicle.
