(57) Abstract :

The present disclosure pertains to alerting device for one or more fluids consumption. The device 100 includes a housing to receive and accommodate the one or more fluids, a first set of sensors 106 configured to detect fluidic attributes of the one or more fluids inside the housing and correspondingly generate a first set of signals, a second set of sensors 108 configured to detect spectral attributes of the one or more fluids and correspondingly generate a second set of signals, a processing unit 110 operatively coupled with the first set of sensors 106, and the second set of sensors 108, and configured to generate a set of alert signals when at least one of fluidic attributes along with quantitative, analytical and chemical attributes associated with first set of signals and the second set of signals is beyond the predefined limit after comparison of the fluidic attributes along with the quantitative, analytical and chemical attributes with predefined limits.
