(57) Abstract :

The present disclosure provides an apparatus 100 for aiding remote teaching, which includes: a frame 102 with a quadrilateral geometry adapted to be placed horizontally against a surface; a writing surface 104 adapted to be removably coupled to the frame in a vertical direction, the writing surface being at least partially transparent such that content on a front face of the writing surface and objects in front of the front face of the writing surface are at least partially visible on a back face of the writing surface; a reflecting surface 106 adapted to be removably coupled to the frame in a vertical direction such that the reflecting surface is configured to at least partially reflect an image of the back face of the writing surface, wherein the reflecting surface is provided at an angle to the face of the writing surface; and an image capture device 108 positioned such that it is configured to capture image received from the reflecting surface, wherein content on a front face of the writing surface and objects in front of the front face of the writing surface are transmitted through the writing surface and subsequently reflected from the reflecting surface, and wherein the image capture device is configured to capture the reflected images to facilitate capture of content on front face of the writing surface.
