(57) Abstract :

The present disclosure relates to an apparatus (100) for providing uninterrupted supply of power, the apparatus includes a lighting device that includes primary circuits (102) and secondary circuits (104) adapted to generate power, a sensor (106) adapted to detect set of signals pertaining to intensity of the light. A controller (108) operatively coupled to a relay (110) and the sensors, the controller configured to receive, from the sensors, the set of signals pertaining to intensity of the light, and analyse, the set of signals to extract a set of value of the set of signals, wherein, when the extracted value of set of signals is lower than a threshold value, the controller is configured to operate the relay to switch from the primary circuits to the secondary circuits, to facilitate uninterrupted power to the lighting device.
