(57) Abstract :

System and method are provided for monitoring a first computing device. According to the method, a set of attributes pertaining to location of the first computing device and a second computing device associated with a user are received. The second computing device then gets associated with one of the plurality of nodes based on the location of the second computing device. Each of the plurality of nodes is associated with a corresponding threshold distance between the first computing device and second computing device associated with the user. Upon association of the second computing device with one of the plurality of nodes, it is determined whether the first computing device is within a threshold distance corresponding to the associated node from the second computing device. An alert is transmitted to the user when the first computing device is not within the threshold distance.
