(57) Abstract :

The present disclosure relates to an antibody's detection device. The device includes a frame with a receptor at one end, and the receptor is configured to be contacted with a blood sample of a person. One or more reactants configured in the frame, and the one or more reactants are configured to react with the blood sample to detect presence of one or more antibodies in the blood sample. One or more markings on the frame, wherein the one or more markings are configured to indicate presence of one or more antibodies in the blood sample when an intensity of the one or more antibodies is more than a pre-defined threshold value.
