(57) Abstract :

The present disclosure pertains to a locking assembly for one or more electronic devices. The assembly includes a first elongate member (104), and the second elongate member (106), where the first elongate member (104), and the second elongate member (106) is attached perpendicularly, and facilitates providing support to the electronic devices from all sides, top surface, and bottom surface. Each of the elongate members (104), (106) includes a plurality of clutches which facilitates movement of the first elongate member (104), and the second elongate member (106) to lock the assembly, a flat bar configured with the second elongate member (106), where the flat bar enables locking with the at least one of the clutches and a first set of cavities , a second set of cavities configured with the second elongate member (106) that enables passing of an elongated bar attached to the first elongate member and lock the assembly (100) using a set of locking means.
