(57) Abstract :

The present disclosure pertains to an apparatus and assembly for automatic feeding. The apparatus (100) includes a housing (102), a cap (104), and a processor (118). The cap (104) includes a set of sensors (106), an edible mixture dispenser (108), a heating element (110), a rotating member (112), a power source (114), and an alert unit (116). The housing (102) is adapted to accommodate a container including water or similar liquid for preparing feeding material. The set of sensors (106) are configured to detect voice and sound and accordingly the processor (118) actuates the edible mixture dispenser (108), the heating element (110), and the rotating member (112) for preparing milk and other liquid supplement. After a boiling point is reached for liquid, the processor (118) facilitates in deactivating the heating element (110), and the rotating member (112), and actuates the alert unit (116). The assembly (104) is configured with existing container.
