(57) Abstract :  
 The present disclosure relates to a system (100) for monitoring the activities of a subject, the system includes a control unit (112) coupled to image-capturing units (102), one or more sensors (104), a moving door module (106), and a staircase detection module (108). The control unit receives the detected and captured images of the movement and location of the subject around the venue. The control unit generates an actuation signal to the moving door module, upon detection of the subject in the vicinity of each door of the one or more doors, to restrict the opening and closing of the one or more doors and generates an actuation signal to the staircase detection module 108, upon detection of the subject in the vicinity of the staircase and communicate the notification message to a computing device associated with the user.
