(57) Abstract :
 Device for relieving muscle pain of a portion of a patient’s body is described. In one example, the device may include a plurality of airbags in contact with the portion of the patient’s body. Each of the plurality of airbags may be configured to exert a volume of air pressure on the muscle of the portion of the patient’s body. The device may further include an inflation module and a deflation module coupled to the plurality of airbags. A controller may be further coupled to the inflation module and the deflation module. The controller is to actuate the inflation module and the deflation module, and based on the actuation, causing the plurality of airbags to alternatively inflate and deflate.
