(57) Abstract :

Embodiments of the present disclosure may include a transport booking system for booking transports from multiple service providers on one platform. The system includes information of a plurality of transport service providers, and plurality of vehicles with their associated drivers. Upon receiving a first request from a person by a computing device, a processor match received source data extracted from the first request with a dataset storing geographical locations of the plurality of vehicles in real-time, to identify one or more of the plurality of vehicles in proximity of the received source data. The plurality of vehicles may be of the multiple service providers, and the person may books the vehicle based on requirement. Also, the system provides booking of shared vehicle, thus enabling the person to check shared vehicle available in proximity by a sinle platform.
