(57) Abstract :

The present disclosure relates a system (100) and a method (300) that includes a processor (102) and memory (104) that execute a set of instructions to verify and authenticate antique items. The system receives a set of data pertaining to one or more antique items from one or more users (114) through one or more computing devices (112) and record the received set of data pertaining to the one or more antique items on a server (110). Additionally, the system also assigns a unique identifier to each of the one or more antique items, stores the unique identifier assigned to each of the one or more antique items in a blockchain and verifies the authenticity of the one or more antique items using the unique identifier assigned to each of the one or more antique items. The processor (102) also can generate a digital authentication certificate for the one or more antique items upon verification of authenticity of the one or more antique items.
