(57) Abstract :

The current invention discloses a mobile identity verification system that utilizes biometric information, such as fingerprint or facial recognition, to verify the user's identity. Biometric data is unique to each individual and significantly more difficult to replicate or steal compared to traditional verification methods. By employing biometric authentication, the mobile identity verification system provided by this invention ensures a high level of effectiveness and trustworthiness. It can be applied in various transactional scenarios, including opening bank accounts, obtaining driver's licenses, and engaging in online shopping. By providing an intuitive and secure approach to identity verification, this system reduces the risk of identity theft and enhances the overall user experience.
