(57) Abstract:

Embodiments of the present disclosure relates to a system (100) and method (300) for delivery of content in a satellite broadband network. In an aspect, the system comprises a processor (202) coupled to a memory (204). The memory (204) stores processor-executable instructions. The processor (202) is configured to broadcast the content from a content source. Further, the processor (202) is configured to deduplicate the broadcast content to remove duplicate data packets. Next, the processor (202) is configured to transmit unique data packets to a satellite transponder based on the deduplicated broadcast content. In the end, the processor (202) is configured to deliver the unique data packets to an end-user.
