(57) Abstract:

Embodiments of the present disclosure relates to a system (100) and method (300) for providing continuous protection against security threats in a network. The system (102) comprises a processor (202) coupled to a memory (204). The memory (204) stores processor-executable instructions. The processor (202) is configured to arrange a plurality of security devices in a redundant and failover configuration. Next, the processor (202) is configured to exchange a status information among the plurality of security devices. Thereafter, the processor (202) is configured to implement network security policies across the plurality of security devices. In the end, the processor (202) is configured to block security threats based on the network security policies.
